# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

### HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations which 80% of the total bed capacity exceeds the beds occupied. Beds currently reported as "expansion beds" and beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

### EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

# WEEKLY HEALTH REPORT

WEEK ENDING 11 DECEMBER 1943

## COMMENT ON CURRENT TRENDS

### CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated in the chart on page 3 morbidity from colds, influenza, etc. increased from an annual rate of about 500 per thousand during the week ending 4 December 1943 to over 630 per thousand during the week ending 11 December 1943. This is about 55 percent higher than the rate prevailing during the corresponding week of 1942 and the highest rate from these causes in the last two years, but considerably below the peak of the influenza epidemic in January 1941, when colds, influenza, etc. were reported at a rate exceeding 1150 per thousand per year.

It is noteworthy that the increase in the rate of admissions from colds, influenza, etc. during the week ending 11 December 1943 was only half as large as during the preceding week. This coupled with the fact that the individual stations and the Service Commands with the highest admission rates for the week ending 4 December 1943 reported either lower or substantially the same morbidity during the week ending 11 December suggests that the peak of the current influenza outbreak has probably been passed in many localities. On 11 December 1943 there were about 83,000 cases of colds, influenza, etc. under treatment among Army personnel in this country.

Morbidity from all forms of pneumonia increased from an annual rate of 15 per thousand during the week ending 4 December to 20 per thousand during the week ending 11 December, which is about 20 percent lower than for the corresponding week of 1942.

As a result of the continued very large numbers of admissions from influenza, the admission rates from all causes and from all diseases combined increased correspondingly to reach what are believed to be the highest points recorded since April 1941. The all causes rate for the week ending 11 December was reported at over 1150 per thousand per year and the all diseases rate at nearly 1090 per thousand, both being about 25 percent above the corresponding week's rate in 1942.

The admission rate from injury continued on a very low level, being less than 70 per thousand and thus considerably below the experience of the last few months.

### VARIATIONS IN MORBIDITY BY SERVICE COMMAND

The largest increases in the admission rate from colds, influenza, etc. were reported from the Military District of Washington and the Second Service Command. In the former the admission rate from colds and influenza for the week ending 11 December reached almost 1290 per thousand per year (as compared with only 528 per thousand the preceding week), while in the latter a rate of 1210 per thousand was reported (as compared with only 691 per thousand the preceding week). The Seventh Service Command with an annual admission rate of about 1010 per thousand and the Fifth Service Command with an annual admission rate of about 1020 per thousand were the only other Service Commands to report morbidity from these causes in excess of 1000 per thousand per year.

The Sixth and Seventh Service Commands, which showed the highest rates of morbidity from these causes during the week ending 4 December were the only Service Commands to report lower rates for the week ending 11 December. The lowest rates of admission from colds, influenza, etc. were again reported from the Eighth and Ninth Service Commands, despite large relative increases in their morbidity rates.

Because of their very high rates of morbidity from colds, influenza, etc. the Second and Seventh Service Commands both showed admission rates from all causes of about 1750 per thousand per year, while the Military District of Washington reported morbidity from all causes exceeding 1900 per thousand. Only the Eighth and the Ninth Service Commands reported morbidity from all causes below 1000.

The six stations having the highest morbidity from colds, influenza, etc. during the week ending 4 December all had lower morbidity this week, and in fact none are among the six highest shown this week.

### CURRENT HOSPITALIZATION CONDITIONS

The total bed capacity increased slightly during the week to more than 356,000 on 11 December 1943, while the beds occupied increased to over 205,000. The number of "available vacant" beds decreased to about 81,000. There were 68 stations with a bed capacity of more than 40,000 which had no "available vacant" beds; among them were 12 general hospitals with a bed capacity of 18,000 beds.

On 11 December there were 1890 cases of malaria remaining under treatment, all but 17 of which were presumably acquired outside of the United States. The number of neuropsychiatric cases remaining under treatment at the end of the week was 16,046.

# SUPPLEMENTAL HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 27 NOV. 1943

## COMMENT ON INJURIES DATA

### PAST TRENDS IN MORBIDITY FOR THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated in the upper portion of the chart on page 31 the annual rate of admission from injuries fluctuated within the relatively narrow limits of 110 to 130 per thousand strength during the peacetime years 1930-40. In 1941 when there was relatively much intensive training in our rapidly growing Army, the rate of admissions from injury increased to almost 150 per thousand strength. In 1942 the rate of admission from injury showed a sharp decrease from the level prevailing during 1941 as a result of special efforts to reduce accidents by education, training and use of safeguards. Since then the morbidity from injuries has stayed considerably below the peacetime level.

In 1942 the rate of admission fluctuated about 90 per thousand, whereas in 1943 to date the rate has been even lower. As indicated in the lower portion of the chart on page 31, in only one month of 1943 has the admission rate exceeded 100 per thousand and for the four-week period ending November 27 was 80 per thousand, the lowest for any month since the early part of the year. There has been some appearance of a seasonal trend in the injury admission rate, with slightly higher rates during the summer months than during the remainder of the year.

### CURRENT DATA FOR STATIONS WITH STRENGTH OF 5000 AND OVER

On pages 32 to 36 there are presented data on injuries for stations with strength of 5000 or over. For all such stations combined (representing about 75 percent of the total strength of the Army in the continental United States) the annual rate of admission for injuries was 77 per thousand strength for the four-week period ending 27 November, or only little different from the rate for the total United States. These stations reported almost 22,000 injuries during this period or about 75 percent of the total number of injuries reported for the continental United States. The mean number of non-effectives as a result of injury was about 5.1 per thousand which was somewhat more than 10 percent of the total non-effective rate including both disease and injury admissions.

In the stations with a strength of 5000 and over there were 304 deaths reported as a result of injuries during the four-week period ending 27 November 1943. This was equivalent to an annual death rate from injuries of 1.1 per thousand. Of the 304 deaths almost 40 percent arose from airplane accidents, while about 20 percent were from automobile and truck accidents. The 304 deaths in these stations represented only about 55 percent of the total deaths from injury in the United States; there were relatively fewer deaths from injury in the larger stations because included in the stations with less than 5000 strength are many air fields, at which a relatively large proportion of the total deaths occur.

Among the stations having the highest injury admission rates for November were Camp Fannin, Fort Oglethorpe, Fort Story and Yuma AAF all of which had rates in excess of 200 per thousand. In considering the non-effective rate on account of injury for the individual stations it should be kept in mind that in some cases the rates shown are too low, since the individuals are not always treated at the particular station but are often transferred to some other station or to a general hospital. The rate for all the larger stations combined as discussed above is likewise probably too low; information for all stations in the United States combined was not available in time for this report.

### COMPARISONS WITH INDUSTRY

From data published by the National Safety Council in "Accident Facts" 1943 edition, it appears that an annual admission rate from injury of about 80 per thousand, such as that reported for November 1943 by Army stations in the continental United States is nearly twice as high as that of all the industries reporting in 1942 to the National Safety Council, and corresponds closely to the 1942 rate for the marine industry.

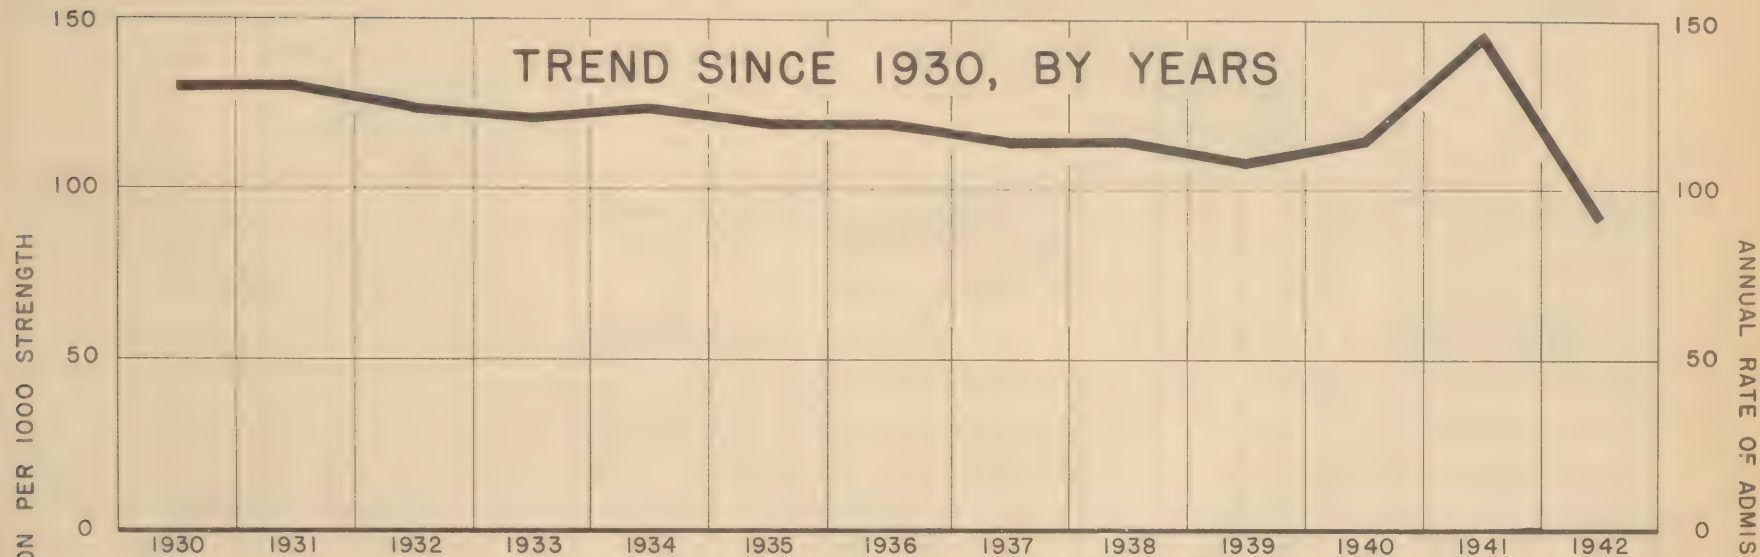

The death rate from injuries for the Army stations having a strength of 5000 or over, which was reported at 1.1 per thousand for the four weeks ending 27 November 1943, is about as high as that experienced over a period of years (1932-41) among employees of iron, steel and metal industries insured under group insurance policies.
